

CHAPTER V

CLOSURE

This chapter presents the conclusion and suggestion about the result of the study. The conclusion addresses the answers of research questions in as stated in chapter 1. The suggestions are provided to expect better improvement for lecturers, students, and future researchers related to this field.

A. Conclusion

The objectives of this study are to find out the process of online microteaching practice and pre-service teachers basic teaching skills. Based on the data analysis, the results of the process of online microteaching and supporting by interview data, the researcher found that are some of basic teaching skills quite well practiced, but there is not much variations in online teaching practice that is done and the movement of online teaching practice is quite limited than it is done by direct teaching. Based on the data analysis from questionnaire, the result of research show that basic teaching skills of 5th semester students are quite good, as evidenced by the percentage they get with a percentage of 56% - 82,3 % with good criteria. However, on several occasions, not all of basic teaching skills were applied and mastered optimally. There are some basic teaching skills that are quite difficult to apply, namely managing class and variations skills. Where in managing class skills, they have to learn more how to create and maintain optimal

learning conditions and return them to optimal conditions of things happen that might interfere with learning activities.

B. Suggestion

1. For the lecturer

The lecturer should better understand and develop basic teaching skills in the implementation of microteaching, both online and face to face. Especially in the basic teaching skills section which is considered quite difficult to apply.

2. For the students

Students are expected to pay attention and increase motivation to learn and actively participate in learning, and more pay attention to lecturer when explaining.

3. For the future research

The researcher suggests that there will be future research who explore and investigated about 5th semester students basic teaching skills. Especially if this practice implemented in online learning.
