

CHAPTER V

CLOSURE

A. Conclusion

The research have found and analyze the content of the book in full from chapter 1 to chapter 7. Every chapter covers and discusses different material, but mostly all of them are about interaction to one another. There is only one topic that is not related to direct interaction, that is descriptive text.

This research also found that there are points of assessment indicators that do not match the contents of the book. From all 18 points of content eligibility, the research only found 8 points that correspond to the book. They are completeness of material, width of material, material depth, example accuracy, exercise accuracy, updated references, reasoning and application. However, with this inequality, it doesn't mean the book is completely unusable. This just proves that this book doesn't meet certain criteria that have been formulated. On the other hand, this book still presents various exercises and has a lot of pictures.

B. Suggestion

Researcher suggests anyone who want to conduct a content research to find suitable and updated book. For those who want to write a textbook, it is also advised to load enrichment material. There are so many sources that

can be loaded to the book, from internet or disk, so that people who use the book are interested to explore other sources even though the material is already in the book. If somebody already has an interest, it will make a person excited to understand and solve the exercise in the book.

The researcher also suggests that everyone who wants to research the contents of a book to make preliminary observations of the intended book. With the aim of being able to understand the entire contents of the book and what is in it.

For future researcher it is suggested to do this kind of research with another point. If the is still to be used, there are still 2 main points of discussion, specifically language eligibility and presentation eligibility. Those two points still can be used so this kind of research will be more extensive.
